Aim:

The below sample code finds the **addition** of two matrices.

In the **main()** function read a two two-dimensional array of elements and then find the **addition** of two matrices.

The **logic** is
First checks the **row sizes** and **column sizes** of two two-dimensional arrays are equal or not.
If the sizes are not equal then print "Addition is not possible" and stop the process.
If the sizes are equal then use **two for loops** to add each corresponding elements of two matrices and finally print the result.
Fill in the missing code so that it produces the desired output.
